Dry Run Dive In

- Run 1575, pedestal run
- Run 1576, physics run, trigger: NHit>50
- Run 1590, pedestal run
- Run 1591, LED run, trigger rates:250 hz, trigger: NHit>150, LED voltage = -7.2 V
- Run 1592, LED run, trigger rates:605 hz, trigger: NHit>100, LED voltage = -7.2 V
- Run 1593, LED run, trigger rates:605 hz, trigger: NHit>100, LED voltage = -7.3 V
- Run 1594, LED run, trigger rates:605 hz, trigger: NHit>100, LED voltage = -7.4 V
- Run 1595, LED run, trigger rates:605 hz, trigger: NHit>100, LED voltage = -7.8 V

ADC value for PMT (ring=1, column=1)

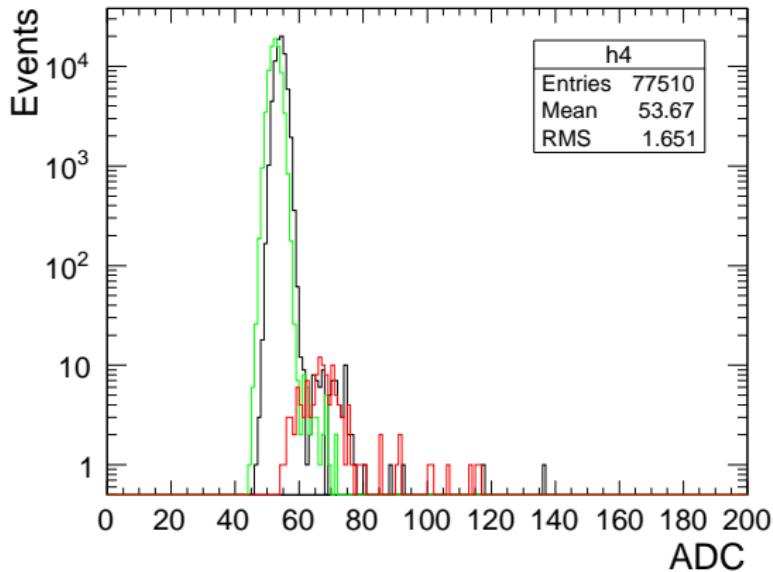

- Black: Run 1590 ADC value, Green: Run 1590 preADC value.
- Red: Run 1575 ADC value.

Pedestal comparison

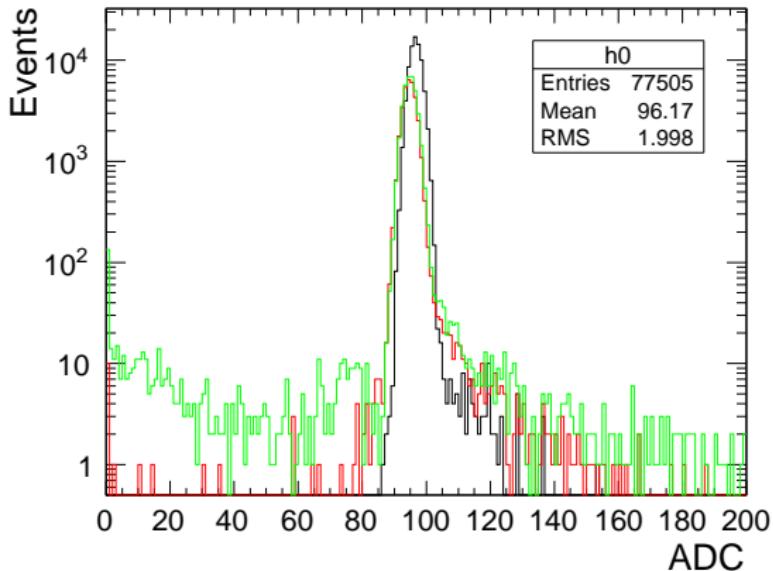

- Black: Run 1590 ADC value mean and rms, Green: Run 1590 preADC value.
- Red: Run 1575 ADC value.
- Some problem channels. Run 1590:
PMT($\text{ring}=1, \text{column}=13$), PMT($\text{ring}=5, \text{column}=2$).
Run 1575: PMT($\text{ring}=1, \text{column}=5$)

Problem channel

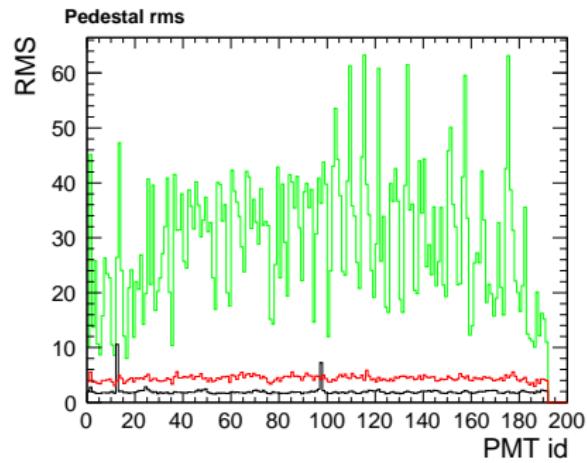

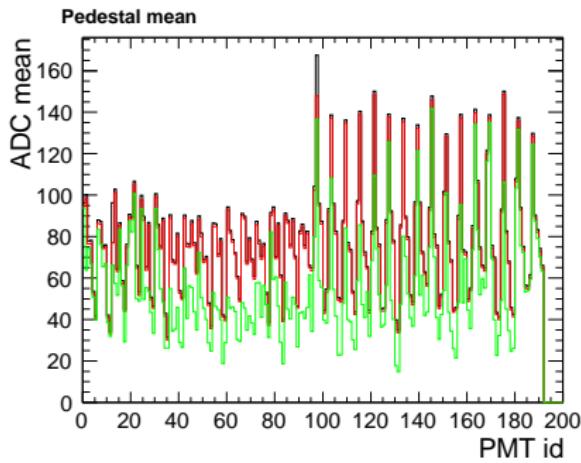

- Problem channels have very few hits.

PMT pedestal (ring=1, column=1)

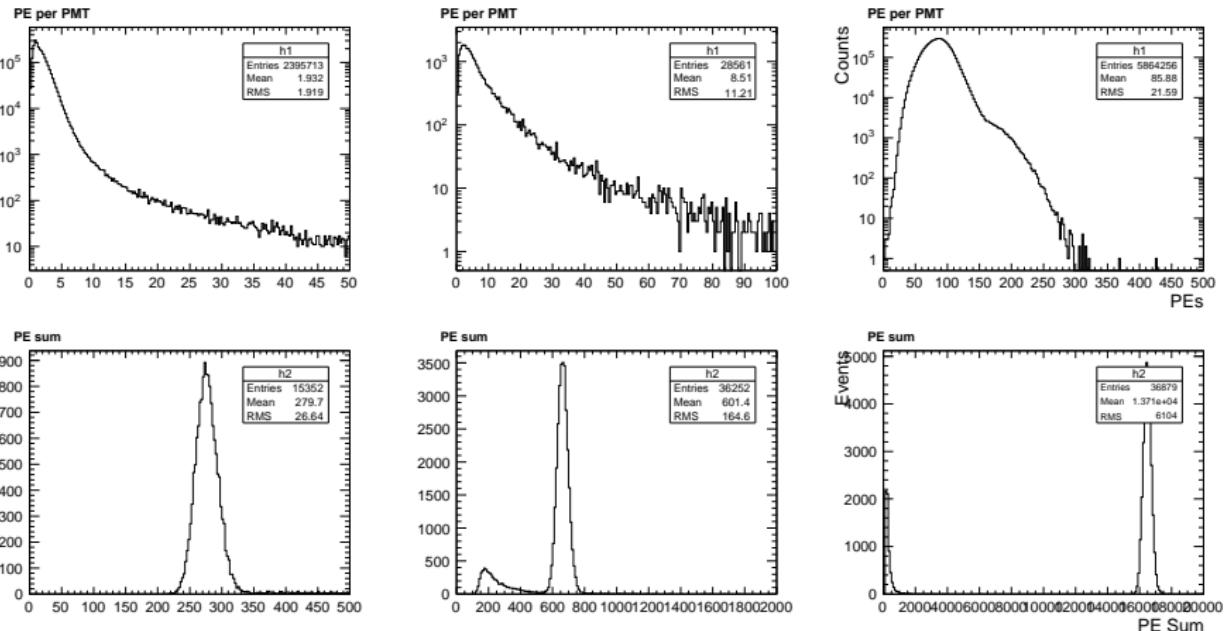

- Black: Run 1590 pedestal ADC mean & rms
- Red: Run 1593 preADC mean & rms
- Green: Run 1595 preADC mean & rms

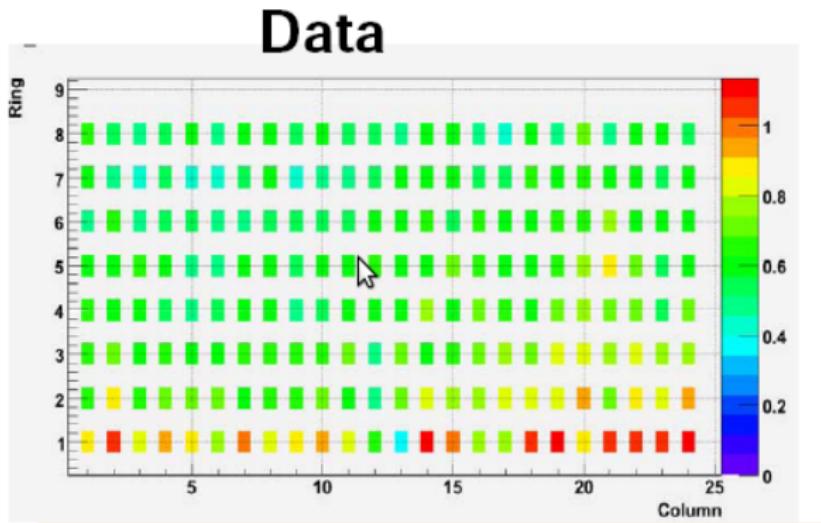

- Black: Run 1590 pedestal ADC mean & rms
- Red: Run 1593 preADC mean & rms
- Green: Run 1595 preADC mean & rms

PE sum distribution

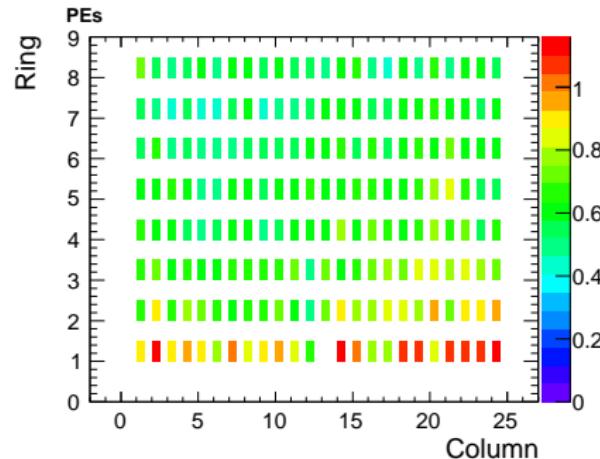

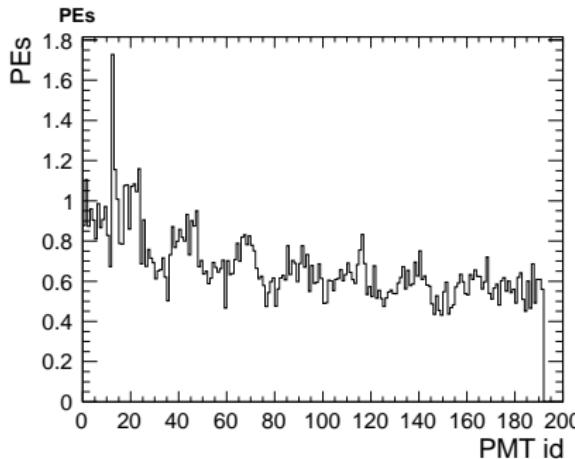

- Run 1591, Run1593, Run1595
- Use pedestal values from Run 1590. $PE = (ADC-ped)/20$.

- Doc 5062, Haoqi's study
- Quite large fluctuation at the bottom rings, not seen in MC.

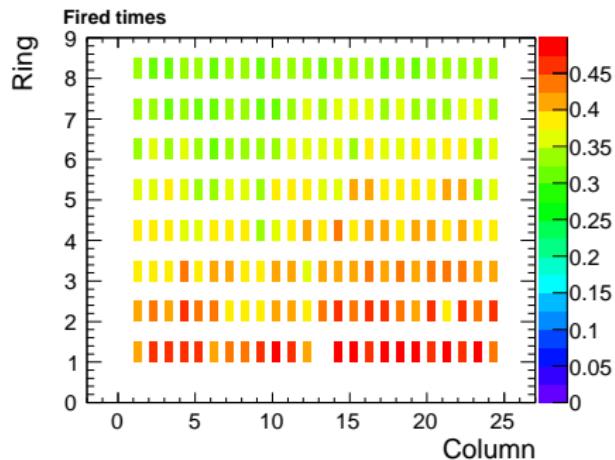

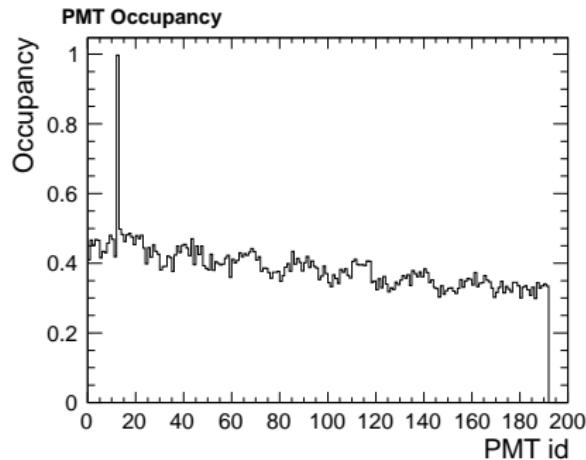

Hits

- Studied the first 120000 triggers in Run 1576.
- Pedestal subtracted, $PE = (ADC-ped)/20$. No other calibration.
- Channel 13 (PMT ring=1, column=13) is very hot (skipped in the color map).

Occupancy

- Channel 13 is very hot (skipped in the color map).
- Much less fluctuation in occupancy distribution. Large fluctuation in PE distribution probably comes from lack of gain and quantum efficiency calibration.
